

(A)

(B)

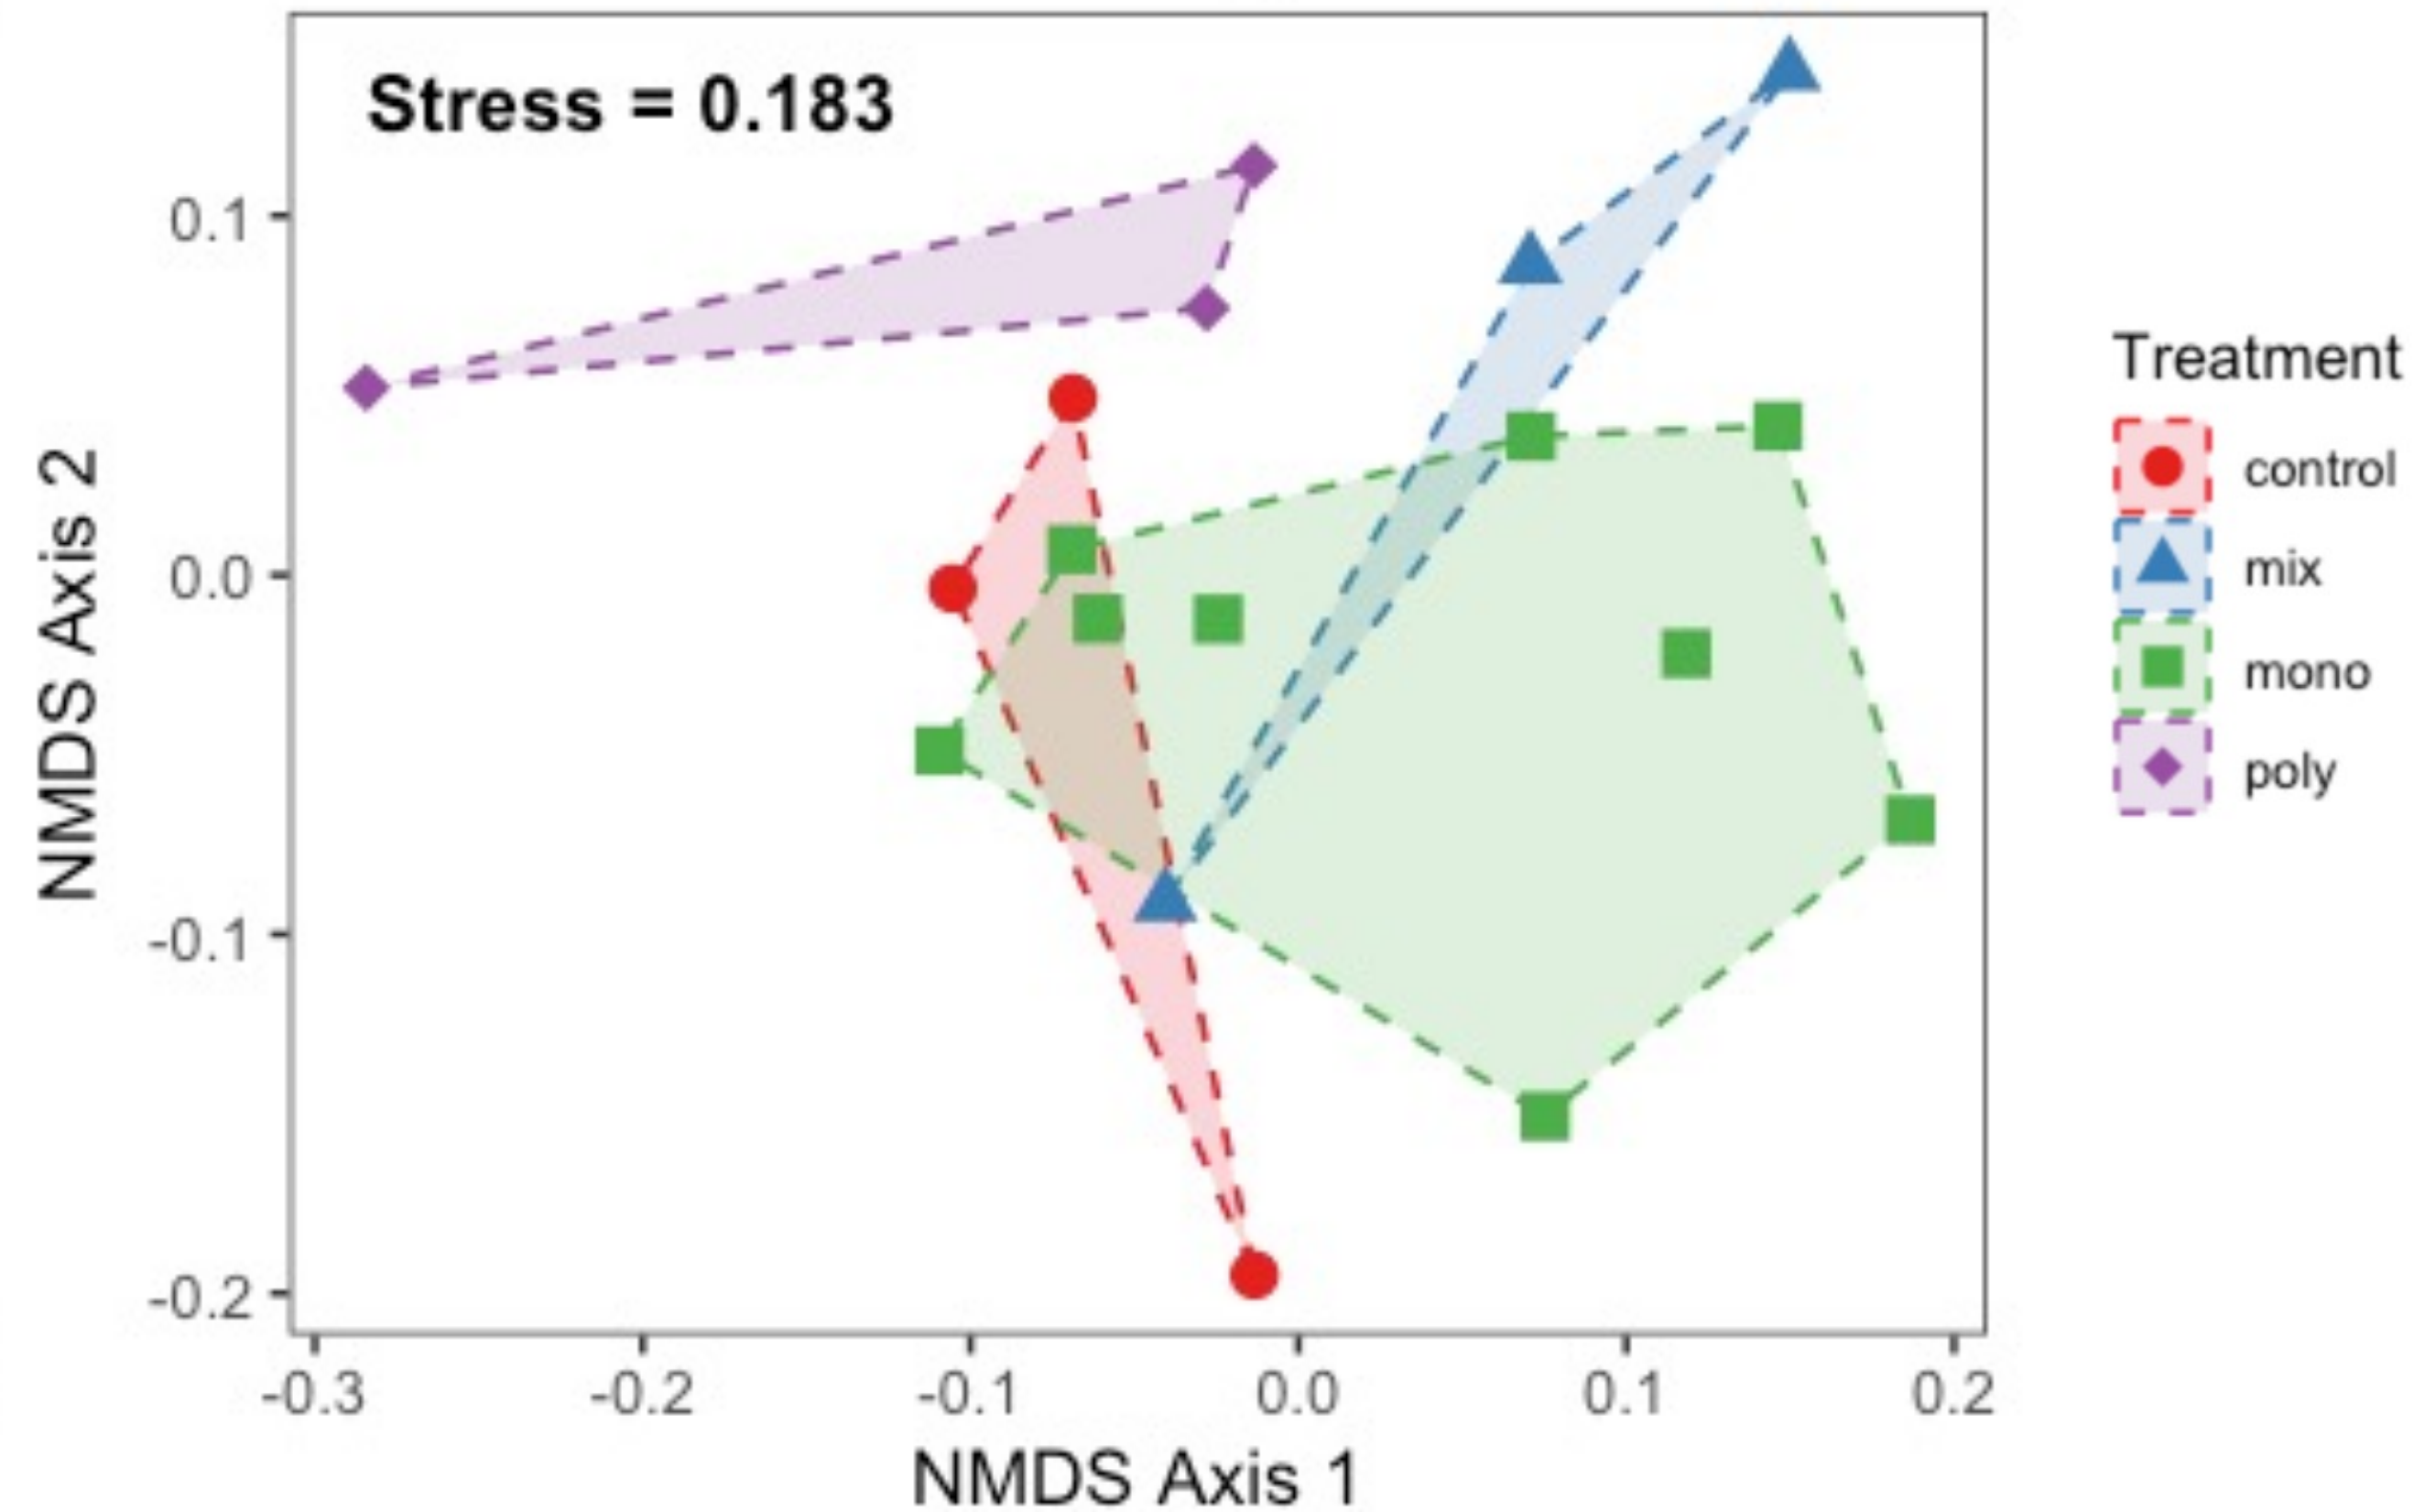

Figure 5: Non-metric Multidimensional Scaling (NMDS) ordinations of community composition based on Bray-Curtis dissimilarity for (A) macrofauna count data and (B) the full molecular assemblage (combined motile and sessile metabarcoding). Points are color-coded by restoration treatment: control (red), monoculture (green), mixed-culture (blue), and polyculture (purple). Convex hulls enclose all points within each treatment group, illustrating the extent of community dispersion and separation.
